

# Package ‘lpirfs’

October 1, 2025

**Type** Package

**Title** Local Projections Impulse Response Functions

**Version** 0.2.5

**Maintainer** Philipp Adämmer <philipp.adaemmer@uni-greifswald.de>

**BugReports** <https://github.com/adaemmerp/lpirfs/issues>

**Description** Provides functions to estimate and visualize linear as well as nonlinear impulse responses based on local projections by Jordà (2005) <[doi:10.1257/0002828053828518](https://doi.org/10.1257/0002828053828518)>. The methods and the package are explained in detail in Adämmer (2019) <[doi:10.32614/RJ-2019-052](https://doi.org/10.32614/RJ-2019-052)>.

**License** GPL (>= 2)

**Depends** R (>= 3.1.2)

**Encoding** UTF-8

**LazyData** true

**NeedsCompilation** yes

**Imports** doParallel(>= 1.0.15), dplyr(>= 1.0.0), foreach(>= 1.5.0), ggplot2(>= 3.3.0), gridExtra(>= 2.3), lmtest(>= 0.9-36), plm(>= 2.2-3), sandwich(>= 2.5-1), Rcpp(>= 1.0.4.6)

**RoxygenNote** 7.3.1

**LinkingTo** Rcpp, RcppArmadillo

**Suggests** testthat (>= 3.0.0), AER(>= 1.2-12), readxl, knitr, ggpubr, rmarkdown, zoo, vars

**VignetteBuilder** knitr

**Config/testthat/edition** 3

**Author** Philipp Adämmer [aut, cre] (ORCID: <<https://orcid.org/0000-0003-3770-0097>>), James P. LeSage [ctb], Mehmet Balcilar [ctb], Jon Danielsson [ctb]

**Repository** CRAN

**Date/Publication** 2025-10-01 13:20:02 UTC

lpirfs-package	<i>Local Projection Impulse Response Functions</i>
----------------	--

---

## Description

lpirfs provides functions to estimate and plot linear as well as nonlinear impulse responses based on local projections by Jordà (2005) <doi:10.1257/0002828053828518>. The methods and the package are explained in detail in Adämmer (2019) <doi:10.32614/RJ-2019-052>. Please cite the paper when using the package.

---

ag\_data

*Data to estimate fiscal multipliers*

---

**Description**

A tibble, containing data to estimate fiscal multipliers. This data was originally used by Auerbach and Gorodnichenko (2012). Sarah and Zubairy (2018) use this data to re-evaluate their results with local projections.

**Usage**

```
ag_data
```

**Format**

A tibble with 248 quarterly observations (rows) and 7 variables (columns):

**Year** Year of observation.

**Quarter** Quarter of observation.

**Gov** Logs of real government (federal, state, and local) purchases (consumption and investment).

**Tax** Logs of real government receipts of direct and indirect taxes net of transfers to businesses and individuals.

**GDP** Logs of real gross domestic product.

**GDP\_MA** 7-quarter moving average growth rate of GDP.

**Gov\_shock\_mean** Identified government spending shock. For details see Supplementary Appendix of Ramey and Zubairy (2018).

Sample: 1948:IV - 2008:IV

---

`get_robust_cov_panel`     *Function to get robust covariance matrix for panel data*

---

**Description**

Function to get robust covariance matrix for panel data

**Usage**

```
get_robust_cov_panel(panel_results, specs)
```

**Arguments**

<code>panel_results</code>	Plm object from estimation
<code>specs</code>	List with specifications

**Value**

Object with robust covariance matrix

---

`hp_filter`     *Decompose a times series via the Hodrick-Prescott filter*

---

**Description**

Estimate cyclical and trend component with filter by Hodrick and Prescott (1997). The function is based on the function *hpfilter* from the archived *mFilter*-package.

**Usage**

```
hp_filter(x, lambda)
```

**Arguments**

<code>x</code>	One column matrix with numeric values.
<code>lambda</code>	Numeric value.

**Value**

A list. The first element contains the cyclical component and the second element the trend component.

**Author(s)**

Philipp Adämmer

## Examples

```
library(lpirfs)

# Decompose the Federal Funds Rate
data_set    <- as.matrix(interest_rules_var_data$FF)
hp_results  <- hp_filter(data_set, 1600)

# Extract results and save as data.frame
hp_cyc      <- as.data.frame(hp_results[[1]])
hp_trend    <- as.data.frame(hp_results[[2]])

# Make data.frames for plots
cyc_df      <- data.frame(yy = hp_cyc$V1, xx = seq(as.Date('1955-01-01'),
                                                  as.Date('2003-01-01') , "quarter"))
trend_df    <- data.frame(yy = hp_trend$V1, xx = seq(as.Date('1955-01-01'),
                                                  as.Date('2003-01-01') , "quarter"))

# Make plots
library(ggplot2)

# Plot cyclical part
ggplot(data = cyc_df) +
  geom_line(aes(y = yy, x = xx))

# Plot trend component
ggplot(trend_df) +
  geom_line(aes(y = yy, x = xx))
```

---

interest\_rules\_var\_data

*Data to estimate the effects of interest rate rules for monetary policy*

---

## Description

A tibble, containing data to estimate the effects of interest rate rules for monetary policy. The data are used by Jordà (2005).

## Usage

```
interest_rules_var_data
```

**Format**

A tibble with 193 quarterly observations (rows) and 3 variables (columns):

**GDP\_gap** Percentage difference between real GDP and potential GDP (Congressional Budget Office).

**Infl** Inflation: Percentage change in the GDP, chain weighted price index at annual rate.

**FF** Federal funds rate: quarterly average of daily rates.

Sample: 1955:I - 2003:I

lpirfs\_obj-methods-base

*Base methods for lpirfs\_obj objects*

---

**Description**

Base methods for lpirfs\_obj objects

---

lp\_lin

*Compute linear impulse responses*

---

**Description**

Compute linear impulse responses with local projections by Jordà (2005).

**Usage**

```
lp_lin(
  endog_data,
  lags_endog_lin = NULL,
  lags_criterion = NaN,
  max_lags = NaN,
  trend = NULL,
  shock_type = NULL,
  confint = NULL,
  use_nw = TRUE,
```

```

nw_lag = NULL,
nw_prewHITE = FALSE,
adjust_se = FALSE,
hor = NULL,
exog_data = NULL,
lags_exog = NULL,
contemp_data = NULL,
num_cores = 1
)

```

### Arguments

endog_data	A <a href="#">data.frame</a> , containing the endogenous variables for the VAR. The Cholesky decomposition is based on the column order.
lags_endog_lin	NaN or integer. NaN if lag length criterion is used. Integer for number of lags for <i>endog_data</i> .
lags_criterion	NaN or character. NaN (default) means that the number of lags has to be given at <i>lags_endog_lin</i> . The character specifies the lag length criterion ('AICc', 'AIC' or 'BIC').
max_lags	NaN or integer. Maximum number of lags if <i>lags_criterion</i> is given. NaN (default) otherwise.
trend	Integer. No trend = 0, include trend = 1, include trend and quadratic trend = 2.
shock_type	Integer. Standard deviation shock = 0, unit shock = 1.
confint	Double. Width of confidence bands. 68% = 1; 90% = 1.65; 95% = 1.96.
use_nw	Boolean. Use Newey-West (1987) standard errors for impulse responses? TRUE (default) or FALSE.
nw_lag	Integer. Specifies the maximum lag with positive weight for the Newey-West estimator. If set to NULL (default), the lag increases with with the number of horizon.
nw_prewHITE	Boolean. Should the estimators be pre-whitened? TRUE or FALSE (default).
adjust_se	Boolean. Should a finite sample adjustment be made to the covariance matrix estimators? TRUE or FALSE (default).
hor	Integer. Number of horizons for impulse responses.
exog_data	A <a href="#">data.frame</a> , containing exogenous variables for the VAR. The row length has to be the same as <i>endog_data</i> . Lag lengths for exogenous variables have to be given and will not be determined via a lag length criterion.
lags_exog	NULL or Integer. Integer for the number of lags for the exogenous data. The value cannot be 0. If you want to include exogenous data with contemporaneous impact use <i>contemp_data</i> .
contemp_data	A <a href="#">data.frame</a> , containing exogenous data with contemporaneous impact. This data will not be lagged. The row length has to be the same as <i>endog_data</i> .
num_cores	NULL or Integer. The number of cores to use for the estimation. If NULL, the function will use the maximum number of cores minus one.

**Value**

A list containing:

<code>irf_lin_mean</code>	A three 3D <a href="#">array</a> , containing all impulse responses for all endogenous variables. The last dimension denotes the shock variable. The row in each matrix gives the responses of the <i>ith</i> variable, ordered as in <code>endog_data</code> . The columns denote the horizons. For example, if <code>results_lin</code> contains the list with results, <code>results_lin\$irf_lin_mean[, , 1]</code> returns a KXH matrix, where K is the number of variables and H the number of horizons. '1' is the shock variable, corresponding to the first variable in <code>endog_data</code> .
<code>irf_lin_low</code>	A three 3D <a href="#">array</a> containing all lower confidence bands of the responses, based on robust standard errors by Newey and West (1987). Properties are equal to <code>irf_lin_mean</code> .
<code>irf_lin_up</code>	A three 3D <a href="#">array</a> containing all upper confidence bands of the responses, based on robust standard errors by Newey and West (1987). Properties are equal to <code>irf_lin_mean</code> .
<code>diagnostic_list</code>	A list OLS diagnostics. To see everything you can simply use <code>summary()</code> or <code>results\$diagnostic_list</code> . The first entry the shock variable. The rows of each shown matrix then denotes the endogenous variable that reacts to the shock.
<code>specs</code>	A list with properties of <code>endog_data</code> for the plot function. It also contains lagged data ( <code>y_lin</code> and <code>x_lin</code> ) used for the irf estimations, and the selected lag lengths when an information criterion has been used.

```

## Example without exogenous variables

# Load package
library(lpirfs)

# Load (endogenous) data
endog_data <- interest_rules_var_data

# Estimate linear model
results_lin <- lp_lin(endog_data,
                      lags_endog_lin = 4,
                      trend          = 0,
                      shock_type     = 1,
                      confint        = 1.96,
                      hor             = 12)

# Show all impulse responses
# Compare with Figure 5 in Jordà (2005)
plot(results_lin)

# Make individual plots
linear_plots <- plot_lin(results_lin)

# Show single plots
# * The first element of 'linear_plots' shows the response of the first
#   variable (GDP_gap) to a shock in the first variable (GDP_gap).
# * The second element of 'linear_plots' shows the response of the first
#   variable (GDP_gap) to a shock in the second variable (inflation).
# * ...

linear_plots[[1]]
linear_plots[[2]]

# Show diagnostics. The first element corresponds to the first shock variable.
summary(results_lin)

## Example with exogenous variables ##

# Load (endogenous) data
endog_data <- interest_rules_var_data

# Create exogenous data and data with contemporaneous impact (for illustration purposes only)
exog_data  <- endog_data$GDP_gap*endog_data$Infl*endog_data$FF + rnorm(dim(endog_data)[1])
contemp_data <- endog_data$GDP_gap*endog_data$Infl*endog_data$FF + rnorm(dim(endog_data)[1])

# Exogenous data has to be a data.frame
exog_data  <- data.frame(xx = exog_data )
contemp_data <- data.frame(cc = contemp_data)

```

```

# Estimate linear model
results_lin <- lp_lin(endog_data,
                      lags_endog_lin = 4,
                      trend          = 0,
                      shock_type     = 1,
                      confint         = 1.96,
                      hor             = 12,
                      exog_data       = exog_data,
                      lags_exog       = 4,
                      contemp_data    = contemp_data)

# Show all impulse responses
plot(results_lin)

# Show diagnostics. The first element corresponds to the first shock variable.
summary(results_lin)

```

---

lp_lin_iv	<i>Compute linear impulse responses with identified shock and/or with 2SLS</i>
-----------	--

---

## Description

Compute linear impulse responses with identified shock and/or with 2SLS.

## Usage

```

lp_lin_iv(
  endog_data,
  shock = NULL,
  cumul_mult = FALSE,
  instr = NULL,
  use_twosls = FALSE,
  instrum = NULL,
  lags_endog_lin = NULL,
  exog_data = NULL,
  lags_exog = NULL,
  contemp_data = NULL,
  lags_criterion = NaN,
  max_lags = NaN,
  trend = NULL,
  confint = NULL,
  use_nw = TRUE,
  nw_lag = NULL,
  nw_prewhite = FALSE,
  adjust_se = FALSE,
  hor = NULL,

```

```

    num_cores = 1
)

```

### Arguments

endog_data	A <a href="#">data.frame</a> , containing the values of the dependent variable(s).
shock	A one column <a href="#">data.frame</a> , including the variable to shock with. The row length has to be the same as <i>endog_data</i> . When <i>use_twosls</i> = <i>TRUE</i> , this variable will be approximated/regressed on the instrument variable(s) given in <i>instrum</i> .
cumul_mult	Boolean. Estimate cumulative multipliers? TRUE or FALSE (default). If TRUE, cumulative responses are estimated via: <div style="text-align: center;"> <math display="block">y_{(t+h)} - y_{(t-1)},</math> </div> where $h = 0, \dots, H-1$ . This option is only available for <i>lags_criterion</i> = <i>NaN</i> .
instr	Deprecated input name. Use <i>shock</i> instead. See <i>shock</i> for details.
use_twosls	Boolean. Use two stage least squares? TRUE or FALSE (default).
instrum	A <a href="#">data.frame</a> , containing the instrument(s) to use for 2SLS. This instrument will be used for the variable in <i>shock</i> .
lags_endog_lin	NaN or integer. NaN if lags are chosen by a lag length criterion. Integer for number of lags for <i>endog_data</i> .
exog_data	A <a href="#">data.frame</a> , containing exogenous variables. The row length has to be the same as <i>endog_data</i> . Lag lengths for exogenous variables have to be given and will not be determined via a lag length criterion.
lags_exog	NULL or Integer. Integer for the number of lags for the exogenous data. The value cannot be 0. If you want to include exogenous data with contemporaneous impact use 'contemp_data'.
contemp_data	A <a href="#">data.frame</a> , containing exogenous data with contemporaneous impact. The row length has to be the same as <i>endog_data</i> .
lags_criterion	NaN or character. NaN means that the number of lags will be given at <i>lags_endog_lin</i> . Possible lag length criteria are 'AICc', 'AIC' or 'BIC'. Note that when <i>use_twosls</i> = <i>TRUE</i> , the lag lengths are chosen based on normal OLS regressions, without using the instruments.
max_lags	NaN or integer. Maximum number of lags if <i>lags_criterion</i> is a character denoting the lag length criterion. NaN otherwise.
trend	Integer. No trend = 0, include trend = 1, include trend and quadratic trend = 2.
confint	Double. Width of confidence bands. 68% = 1; 90% = 1.65; 95% = 1.96.
use_nw	Boolean. Use Newey-West (1987) standard errors for impulse responses? TRUE (default) or FALSE.
nw_lag	Integer. Specifies the maximum lag with positive weight for the Newey-West estimator. If set to NULL (default), the lag increases with the number of horizon.
nw_prewHITE	Boolean. Should the estimators be pre-whitened? TRUE or FALSE (default).

adjust_se	Boolean. Should a finite sample adjustment be made to the covariance matrix estimators? TRUE or FALSE (default).
hor	Integer. Number of horizons for impulse responses.
num_cores	NULL or Integer. The number of cores to use for the estimation. If NULL, the function will use the maximum number of cores minus one.

### Value

A list containing:

irf_lin_mean	A <a href="#">matrix</a> , containing the impulse responses. The row in each matrix denotes the response of the <i>ith</i> variable to the shock. The columns are the horizons.
irf_lin_low	A <a href="#">matrix</a> , containing all lower confidence bands of the impulse responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_lin_mean</i> .
irf_lin_up	A <a href="#">matrix</a> , containing all upper confidence bands of the impulse responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_lin_mean</i> .
specs	A list with properties of <i>endog_data</i> for the plot function. It also contains lagged data ( <i>y_lin</i> and <i>x_lin</i> ) used for the estimations of the impulse responses, and the selected lag lengths when an information criterion has been used.

lp_lin_panel	<i>Compute linear impulse responses with local projections for panel data</i>
--------------	---

---

### Description

This function estimates impulse responses with local projections for panel data, either with an identified shock or by an instrument variable approach.

### Usage

```

lp_lin_panel(
  data_set = NULL,
  data_sample = "Full",
  endog_data = NULL,
  cumul_mult = TRUE,
  shock = NULL,
  diff_shock = TRUE,
  iv_reg = FALSE,
  instrum = NULL,
  panel_model = "within",
  panel_effect = "individual",
  robust_cov = NULL,
  robust_method = NULL,
  robust_type = NULL,
  robust_cluster = NULL,
  robust_maxlag = NULL,
  use_gmm = FALSE,
  gmm_model = "onestep",
  gmm_effect = "twoways",
  gmm_transformation = "d",
  c_exog_data = NULL,
  l_exog_data = NULL,
  lags_exog_data = NaN,
  c_fd_exog_data = NULL,
  l_fd_exog_data = NULL,

```

```
lags_fd_exog_data = NaN,
confint = NULL,
hor = NULL
)
```

### Arguments

data_set	A <a href="#">data.frame</a> , containing the panel data set. The first column has to be the variable denoting the cross section. The second column has to be the variable denoting the time section.
data_sample	Character or numeric. To use the full sample set value to "Full" (default). To estimate a subset, you have to provide a sequence of dates. This sequence has to be in the same format as the second column (time-section).
endog_data	Character. The column name of the endogenous variable. You can only provide one endogenous variable at a time.
cumul_mult	Boolean. Estimate cumulative multipliers? TRUE (default) or FALSE. If TRUE, cumulative responses are estimated via:

$$y_{(t+h)} - y_{(t-1)},$$

where  $h = 0, \dots, H-1$ .

shock	Character. The column name of the variable to shock with.
diff_shock	Boolean. Take first differences of the shock variable? TRUE (default) or FALSE. Note that when using this option both shock and instrument are used in first differences
iv_reg	Boolean. Use instrument variable approach? TRUE or FALSE.
instrum	NULL or Character. The name(s) of the instrument variable(s) if iv_reg = TRUE.
panel_model	Character. Type of panel model. The default is "within" (fixed effects). Other options are "random", "ht", "between", "pooling" or "fd". See vignette of the plm package for details.
panel_effect	Character. The effects introduced in the model. Options are "individual" (default), "time", "twoways", or "nested". See the vignette of the plm-package for details.
robust_cov	NULL or Character. The character specifies the method how to estimate robust standard errors: Options are "vcovBK", "vcovDC", "vcovG", "vcovHC", "vcovNW", "vcovSCC". For these options see vignette of plm package. Another option is "Vext". For details see Miller (2017) If "use_gmm = TRUE", this option has to be NULL.
robust_method	NULL (default) or Character. The character is an option when robust_cov = "vcovHC". See vignette of the plm package for details.
robust_type	NULL (default) or Character. The character is an option when robust_cov = "vcovBK", "vcovDC", "vcovHC", "vcovNW" or "vcovSCC". See vignette of the plm package for details.
robust_cluster	NULL (default) or Character. The character is an option when robust_cov = "vcovBK", "vcovG" or "vcovHC". See vignette of the plm package for details.

robust_maxlag	NULL (default) or Character. The character is an option when robust_cov = "vcovNW" or "vcovSCC". See vignette of the plm package for details.
use_gmm	Boolean. Use GMM for estimation? TRUE or FALSE (default). See vignette of plm package for details. If TRUE, the option "robust_cov" has to be set to NULL.
gmm_model	Character. Either "onestep" (default) or "twosteps". See vignette of the plm package for details.
gmm_effect	Character. The effects introduced in the model: "twoways" (default) or "individual". See vignette of the plm-package for details.
gmm_transformation	Character. Either "d" (default) for the "difference GMM" model or "ld" for the "system GMM". See vignette of the plm package for details.
c_exog_data	NULL or Character. Name(s) of the exogenous variable(s) with contemporaneous impact.
l_exog_data	NULL or Character. Name(s) of the exogenous variable(s) with lagged impact.
lags_exog_data	Integer. Lag length for the exogenous variable(s) with lagged impact.
c_fd_exog_data	NULL or Character. Name(s) of the exogenous variable(s) with contemporaneous impact of first differences.
l_fd_exog_data	NULL or Character. Name(s) of exogenous variable(s) with lagged impact of first differences.
lags_fd_exog_data	NaN or Integer. Number of lags for variable(s) with impact of first differences.
confint	Double. Width of confidence bands. 68% = 1; 90% = 1.65; 95% = 1.96.
hor	Integer. Number of horizons for impulse responses.

### Value

A list containing:

irf_lin_mean	A <a href="#">matrix</a> , containing the impulse responses. The columns are the horizons.
irf_lin_low	A <a href="#">matrix</a> , containing all lower confidence bands. The columns are the horizons.
irf_lin_up	A <a href="#">matrix</a> , containing all upper confidence bands. The columns are the horizons.
reg_outputs	Full regression output (plm object) for each horizon.
reg_summaries	Summary of regression output for each horizon. In case of robust covariance estimators, this only includes the t-tests.
xy_data_sets	Data sets with endogenous and exogenous variables for each horizon.
specs	A list with data properties for e.g. the plot function.

lp\_nl

*Compute nonlinear impulse responses*

### Description

Compute nonlinear impulse responses with local projections by Jordà (2005). The data can be separated into two states by a smooth transition function as applied in Auerbach and Gorodnichenko (2012), or by a simple dummy approach.

### Usage

```

lp_nl(
  endog_data,
  lags_endog_lin = NULL,
  lags_endog_nl = NULL,
  lags_criterion = NaN,
  max_lags = NaN,
  trend = NULL,
  shock_type = NULL,
  confint = NULL,
  use_nw = TRUE,
  nw_lag = NULL,
  nw_prewhite = FALSE,
  adjust_se = FALSE,
  hor = NULL,
  switching = NULL,
  lag_switching = TRUE,
  use_logistic = TRUE,
  use_hp = NULL,
  lambda = NULL,

```

```

gamma = NULL,
exog_data = NULL,
lags_exog = NULL,
contemp_data = NULL,
num_cores = 1
)

```

### Arguments

endog_data	A <a href="#">data.frame</a> , containing all endogenous variables for the VAR. The Cholesky decomposition is based on the column order.
lags_endog_lin	NaN or integer. NaN if lag length criterion is used. Integer for number of lags for linear VAR to identify shock.
lags_endog_nl	NaN or integer. Number of lags for nonlinear VAR. NaN if lag length criterion is given.
lags_criterion	NaN or character. NaN (default) means that the number of lags will be given at <i>lags_endog_nl</i> and <i>lags_endog_lin</i> . The lag length criteria are 'AICc', 'AIC' and 'BIC'.
max_lags	NaN or integer. Maximum number of lags (if <i>lags_criterion</i> = 'AICc', 'AIC', 'BIC'). NaN (default) otherwise.
trend	Integer. Include no trend = 0, include trend = 1, include trend and quadratic trend = 2.
shock_type	Integer. Standard deviation shock = 0, unit shock = 1.
confint	Double. Width of confidence bands. 68% = 1; 90% = 1.65; 95% = 1.96.
use_nw	Boolean. Use Newey-West (1987) standard errors for impulse responses? TRUE (default) or FALSE.
nw_lag	Integer. Specifies the maximum lag with positive weight for the Newey-West estimator. If set to NULL (default), the lag increases with with the number of horizon.
nw_prewhite	Boolean. Should the estimators be pre-whitened? TRUE or FALSE (default).
adjust_se	Boolean. Should a finite sample adjustment be made to the covariance matrix estimators? TRUE or FALSE (default).
hor	Integer. Number of horizons for impulse responses.
switching	Numeric vector. A column vector with the same length as <i>endog_data</i> . If 'use_logistic = TRUE', this series can either be decomposed via the Hodrick-Prescott filter (see Auerbach and Gorodnichenko, 2013) or directly plugged into the following logistic function:

$$F_{z_t} = \frac{\exp(-\gamma z_t)}{1 + \exp(-\gamma z_t)}.$$

Important:  $F_{z_t}$  will be lagged by one and then multiplied with the data. If the variable shall not be lagged, use 'lag\_switching = FALSE':

Regime 1 =  $(1 - F(z_{t-1})) * y_{(t-p)}$ ,

Regime 2 =  $F(z_{t-1}) * y_{(t-p)}$ .

lag_switching	Boolean. Use the first lag of the values of the transition function? TRUE (default) or FALSE.
use_logistic	Boolean. Use logistic function to separate states? TRUE (default) or FALSE. If FALSE, the values of the switching variable have to be binary (0/1).
use_hp	Boolean. Use HP-filter? TRUE or FALSE.
lambda	Double. Value of $\lambda$ for the Hodrick-Prescott filter (if use_hp = TRUE).
gamma	Double. Positive number which is used in the transition function.
exog_data	A <a href="#">data.frame</a> , containing exogenous variables for the VAR. The row length has to be the same as <i>endog_data</i> . Lag lengths for exogenous variables have to be given and will not be determined via a lag length criterion.
lags_exog	NULL or Integer. Integer for the number of lags for the exogenous data. The value cannot be 0. If you want to include exogenous data with contemporaneous impact use <i>contemp_data</i> .
contemp_data	A <a href="#">data.frame</a> , containing exogenous data with contemporaneous impact. This data will not be lagged. The row length has to be the same as <i>endog_data</i> .
num_cores	Integer. The number of cores to use for the estimation. If NULL, the function will use the maximum number of cores minus one.

### Value

A list containing:

irf_s1_mean	A three-dimensional array, containing all impulse responses for all endogenous variables of the first state. The last dimension denotes the shock variable. The row in each matrix denotes the responses of the <i>ith</i> variable, ordered as in <i>endog_data</i> . The columns are the horizons. For example, if the results are saved in <i>results_nl</i> , <code>results_nl\$irf_s1_mean[, , 1]</code> returns a KxH matrix, where K is the number of variables and H is the number of horizons. '1' is the shock variable, corresponding to the variable in the first column of <i>endog_data</i> .
irf_s1_low	A three-dimensional array, containing all lower confidence bands of the impulse responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_s1_mean</i> .
irf_s1_up	A three-dimensional array, containing all upper confidence bands of the impulse responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_s1_mean</i> .
irf_s2_mean	A three-dimensional array, containing all impulse responses for all endogenous variables of the second state. The last dimension denotes the shock variable. The row in each matrix denotes the responses of the <i>ith</i> variable, ordered as in <i>endog_data</i> . The columns denote the horizon. For example, if the results are saved in <i>results_nl</i> , <code>results_nl\$irf_s2_mean[, , 1]</code> returns a KxH matrix, where K is the number of variables and H is the number of horizons. '1' is the first shock variable corresponding to the variable in the first column of <i>endog_data</i> .
irf_s2_low	A three-dimensional array, containing all lower confidence bands of the responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_s2_mean</i> .

irf_s2_up	A three-dimensional array, containing all upper confidence bands of the responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_s2_mean</i> .
specs	A list with properties of <i>endog_data</i> for the plot function. It also contains lagged data ( <i>y_nl</i> and <i>x_nl</i> ) used for the IRF estimations, and the selected lag lengths when an information criterion has been used.
fz	A vector containing the values of the transition function $F(z_{t-1})$ .

---

*Compute nonlinear impulse responses with identified shock*

---

## Description

Compute nonlinear impulse responses with local projections and identified shock. The data can be separated into two states by a smooth transition function as applied in Auerbach and Gorodnichenko (2012), or by a simple dummy approach.

## Usage

```

lp_nl_iv(
  endog_data,
  lags_endog_nl = NULL,
  shock = NULL,
  cumul_mult = FALSE,
  instr = NULL,
  exog_data = NULL,
  lags_exog = NULL,

```

```

    contemp_data = NULL,
    lags_criterion = NaN,
    max_lags = NaN,
    trend = NULL,
    confint = NULL,
    use_nw = TRUE,
    nw_lag = NULL,
    nw_prewhite = FALSE,
    adjust_se = FALSE,
    hor = NULL,
    switching = NULL,
    lag_switching = TRUE,
    use_logistic = TRUE,
    use_hp = NULL,
    lambda = NULL,
    gamma = NULL,
    num_cores = 1
)

```

### Arguments

endog_data	A <a href="#">data.frame</a> , containing all endogenous variables for the VAR.
lags_endog_nl	NaN or integer. NaN if lags are chosen by a lag length criterion. Integer for number of lags for <i>endog_data</i> .
shock	One column <a href="#">data.frame</a> , including the instrument to shock with. The row length has to be the same as <i>endog_data</i> .
cumul_mult	Boolean. Estimate cumulative multipliers? TRUE or FALSE (default). If TRUE, cumulative responses are estimated via:

$$y_{(t+h)} - y_{(t-1)},$$

where  $h = 0, \dots, H-1$ . This option is only available for *lags\_criterion = NaN*.

instr	Deprecated input name. Use <i>shock</i> instead. See <i>shock</i> for details.
exog_data	A <a href="#">data.frame</a> , containing exogenous variables. The row length has to be the same as <i>endog_data</i> . Lag lengths for exogenous variables have to be given and will not be determined via a lag length criterion.
lags_exog	NULL or Integer. Integer for the number of lags for the exogenous data. The value cannot be 0. If you want to include exogenous data with contemporaneous impact use <i>contemp_data</i> .
contemp_data	A <a href="#">data.frame</a> , containing exogenous data with contemporaneous impact. This data will not be lagged. The row length has to be the same as <i>endog_data</i> .
lags_criterion	NaN or character. NaN means that the number of lags will be given at <i>lags_endog_nl</i> . Possible lag length criteria are 'AICc', 'AIC' or 'BIC'.
max_lags	NaN or integer. Maximum number of lags (if <i>lags_criterion = 'AICc', 'AIC', 'BIC'</i> ). NaN otherwise.
trend	Integer. Include no trend = 0, include trend = 1, include trend and quadratic trend = 2.

confint	Double. Width of confidence bands. 68% = 1; 90% = 1.65; 95% = 1.96.
use_nw	Boolean. Use Newey-West (1987) standard errors for impulse responses? TRUE (default) or FALSE.
nw_lag	Integer. Specifies the maximum lag with positive weight for the Newey-West estimator. If set to NULL (default), the lag increases with the number of horizon.
nw_prewhite	Boolean. Should the estimators be pre-whitened? TRUE or FALSE (default).
adjust_se	Boolean. Should a finite sample adjustment be made to the covariance matrix estimators? TRUE or FALSE (default).
hor	Integer. Number of horizons for impulse responses.
switching	Numeric vector. A column vector with the same length as <i>endog_data</i> . This series can either be decomposed via the Hodrick-Prescott filter (see Auerbach and Gorodnichenko, 2013) or directly plugged into the following smooth transition function: $F_{z_t} = \frac{\exp(-\gamma z_t)}{1 + \exp(-\gamma z_t)}.$ Warning: $F_{z_t}$ will be lagged by one and then multiplied with the data. If the variable shall not be lagged, the vector has to be given with a lead of one. The data for the two regimes are: Regime 1 = $(1 - F(z_{t-1})) * y_{(t-p)}$ , Regime 2 = $F(z_{t-1}) * y_{(t-p)}$ .
lag_switching	Boolean. Use the first lag of the values of the transition function? TRUE (default) or FALSE.
use_logistic	Boolean. Use logistic function to separate states? TRUE (default) or FALSE. If FALSE, the values of the switching variable have to be binary (0/1).
use_hp	Boolean. Use HP-filter? TRUE or FALSE.
lambda	Double. Value of $\lambda$ for the Hodrick-Prescott filter (if use_hp = TRUE).
gamma	Double. Positive number which is used in the transition function.
num_cores	Integer. The number of cores to use for the estimation. If NULL, the function will use the maximum number of cores minus one.

### Value

A list containing:

irf_s1_mean	A <a href="#">matrix</a> , containing the impulse responses of the first regime. The row in each matrix denotes the responses of the <i>ith</i> variable to the shock. The columns are the horizons.
irf_s1_low	A <a href="#">matrix</a> , containing all lower confidence bands of the impulse responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_s1_mean</i> .
irf_s1_up	A <a href="#">matrix</a> , containing all upper confidence bands of the impulse responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_s1_mean</i> .

irf_s2_mean	A <a href="#">matrix</a> , containing all impulse responses for the second regime. The row in each matrix denotes the responses of the <i>ith</i> variable to the shock. The columns denote the horizon.
irf_s2_low	A <a href="#">matrix</a> , containing all lower confidence bands of the responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_s2_mean</i> .
irf_s2_up	A <a href="#">matrix</a> , containing all upper confidence bands of the responses, based on robust standard errors by Newey and West (1987). Properties are equal to <i>irf_s2_mean</i> .
specs	A list with properties of <i>endog_data</i> for the plot function. It also contains lagged data ( <i>y_nl</i> and <i>x_nl</i> ) used for the estimations of the impulse responses, and the selected lag lengths when an information criterion has been used.
fz	A vector, containing the values of the transition function $F(z \setminus \{t-1\})$ .

lp\_nl\_panel

*Compute nonlinear impulse responses for panel data***Description**

This function estimates nonlinear impulse responses by using local projections for panel data with an identified shock. The data can be separated into two states by a smooth transition function as applied in Auerbach and Gorodnichenko (2012), or by a simple dummy approach.

**Usage**

```
lp_nl_panel(
  data_set = NULL,
  data_sample = "Full",
  endog_data = NULL,
  cumul_mult = TRUE,
  shock = NULL,
  diff_shock = TRUE,
  panel_model = "within",
  panel_effect = "individual",
  robust_cov = NULL,
  robust_method = NULL,
  robust_type = NULL,
  robust_cluster = NULL,
  robust_maxlag = NULL,
  use_gmm = FALSE,
  gmm_model = "onestep",
  gmm_effect = "twoways",
  gmm_transformation = "d",
  c_exog_data = NULL,
  l_exog_data = NULL,
  lags_exog_data = NaN,
  c_fd_exog_data = NULL,
  l_fd_exog_data = NULL,
  lags_fd_exog_data = NaN,
  switching = NULL,
  use_logistic = TRUE,
  use_hp = FALSE,
  lag_switching = TRUE,
  lambda = NULL,
  gamma = NULL,
  confint = NULL,
  hor = NULL
)
```

**Arguments**

data_set	A <a href="#">data.frame</a> , containing the panel data set. The first column has to be the variable denoting the cross section. The second column has to be the variable denoting the time section.
data_sample	Character or numeric. To use the full sample set value to "Full" (default). To estimate a subset, you have to provide a sequence of dates. This sequence has to be in the same format as the second column (time-section).
endog_data	Character. The column name of the endogenous variable. You can only provide one endogenous variable at a time.
cumul_mult	Boolean. Estimate cumulative multipliers? TRUE (default) or FALSE. If TRUE, cumulative responses are estimated via:

$$y_{(t+h)} - y_{(t-1)},$$

where  $h = 0, \dots, H-1$ .

shock	Character. The column name of the variable to shock with.
diff_shock	Boolean. Take first differences of the shock variable? TRUE (default) or FALSE. Note that when using this option both shock and instrument are used in first differences
panel_model	Character. Type of panel model. The default is "within" (fixed effects). Other options are "random", "ht", "between", "pooling" or "fd". See vignette of the plm package for details.
panel_effect	Character. The effects introduced in the model. Options are "individual" (default), "time", "twoways", or "nested". See the vignette of the plm-package for details.
robust_cov	NULL or Character. The character specifies the method how to estimate robust standard errors: Options are "vcovBK", "vcovDC", "vcovG", "vcovHC", "vcovNW", "vcovSCC". For these options see vignette of plm package. Another option is "Vext". For details see Miller (2017) If "use_gmm = TRUE", this option has to be NULL.
robust_method	NULL (default) or Character. The character is an option when robust_cov = "vcovHC". See vignette of the plm package for details.
robust_type	NULL (default) or Character. The character is an option when robust_cov = "vcovBK", "vcovDC", "vcovHC", "vcovNW" or "vcovSCC". See vignette of the plm package for details.
robust_cluster	NULL (default) or Character. The character is an option when robust_cov = "vcovBK", "vcovG" or "vcovHC". See vignette of the plm package for details.
robust_maxlag	NULL (default) or Character. The character is an option when robust_cov = "vcovNW" or "vcovSCC". See vignette of the plm package for details.
use_gmm	Boolean. Use GMM for estimation? TRUE or FALSE (default). See vignette of plm package for details. If TRUE, the option "robust_cov" has to be set to NULL.
gmm_model	Character. Either "onestep" (default) or "twosteps". See vignette of the plm package for details.

gmm_effect	Character. The effects introduced in the model: "twoways" (default) or "individual". See vignette of the plm-package for details.
gmm_transformation	Character. Either "d" (default) for the "difference GMM" model or "ld" for the "system GMM". See vignette of the plm package for details.
c_exog_data	NULL or Character. Name(s) of the exogenous variable(s) with contemporaneous impact.
l_exog_data	NULL or Character. Name(s) of the exogenous variable(s) with lagged impact.
lags_exog_data	Integer. Lag length for the exogenous variable(s) with lagged impact.
c_fd_exog_data	NULL or Character. Name(s) of the exogenous variable(s) with contemporaneous impact of first differences.
l_fd_exog_data	NULL or Character. Name(s) of exogenous variable(s) with lagged impact of first differences.
lags_fd_exog_data	NaN or Integer. Number of lags for variable(s) with impact of first differences.
switching	Character. Column name of the switching variable. If "use_logistic = TRUE", this series can either be decomposed by the Hodrick-Prescott filter (see Auerbach and Gorodnichenko, 2013) or directly plugged into the following smooth transition function: $F_{z_t} = \frac{\exp(-\gamma z_t)}{1 + \exp(-\gamma z_t)}.$ The data for the two regimes are lagged by default: Regime 1 = $(1 - F(z_{t-1})) * y_{t-p}$ , Regime 2 = $F(z_{t-1}) * y_{t-p}$ . This option can be suppressed with "lag_switching = FALSE".
use_logistic	Boolean. Use logistic function to separate states? TRUE (default) or FALSE. If FALSE, the values of the switching variable have to be binary (0/1).
use_hp	Boolean. Use HP-filter? TRUE or FALSE (default).
lag_switching	Boolean. Use the first lag of the values of the transition function? TRUE (default) or FALSE.
lambda	Double. Value of $\lambda$ for the Hodrick-Prescott filter (if "use_hp = TRUE").
gamma	Double. Positive value for $\gamma$ , used in the transition function.
confint	Double. Width of confidence bands. 68% = 1; 90% = 1.65; 95% = 1.96.
hor	Integer. Number of horizons for impulse responses.

### Value

A list containing:

irf_lin_mean	A <a href="#">matrix</a> , containing the impulse responses. The columns are the horizons.
irf_lin_low	A <a href="#">matrix</a> , containing all lower confidence bands. The columns are the horizons.
irf_lin_up	A <a href="#">matrix</a> , containing all upper confidence bands. The columns are the horizons.
reg_outputs	Full regression output (plm object) for each horizon.

reg_summaries	Summary of regression output for each horizon. In case of robust covariance estimators, this only includes the t-tests.
xy_data_sets	Data sets with endogenous and exogenous variables for each horizon.
specs	A list with data properties for e.g. the plot function.

```

---

monetary_var_data	<i>Data to estimate a standard monetary VAR</i>
-------------------	---

---

### Description

A tibble, containing data to estimate a standard monetary VAR.

### Usage

```
monetary_var_data
```

### Format

A tibble with 494 monthly observations (rows) and 6 variables (columns):

**EM** Log of non-agricultural payroll employment.

**P** Log of personal consumption expenditures deflator (1996 = 100).

**POCM** Annual growth rate of the index of sensitive materials prices issued by the Conference Board.

**FF** Federal funds rate.

**NBRX** Ratio of nonborrowed reserves plus extended credit to total reserves.

**M2** Annual growth rate of M2 stock.

Sample: 1960:01 - 2001:02.

plot_lin	<i>Compute and display plots of linear impulse responses</i>
----------	--

---

**Description**

Compute and display linear impulse responses, estimated with [lp\\_lin\(\)](#) and [lp\\_lin\\_iv\(\)](#).

**Usage**

```
plot_lin(results_lin)
```

**Arguments**

results\_lin     A [list](#) created with [lp\\_lin\(\)](#) or [lp\\_lin\\_iv\(\)](#).

**Value**

A list with (gg-)plots for linear impulse responses.

**Author(s)**

Philipp Adämmer

**Examples**

```
# See examples for lp_lin() and lp_lin_iv().
```

---

plot_nl	<i>Compute and display plots of nonlinear impulse responses</i>
---------	---

---

**Description**

Compute and display (nonlinear) impulse responses, estimated with [lp\\_nl\(\)](#) and [lp\\_nl\\_iv\(\)](#).

**Usage**

```
plot_nl(results_nl)
```

**Arguments**

results\_nl     A [list](#) created with [lp\\_nl\(\)](#) or [lp\\_nl\\_iv\(\)](#).

**Value**

A list with (gg-)plots for nonlinear impulse responses.

**Author(s)**

Philipp Adämmmer

**Examples**

```
# Load package

# See examples for lp_nl() and lp_nl_iv().
